Social Skills

Background Information

Social skills are important for everyone and critical to successful functioning in life. Though the debate goes back and forth—is it the family or the school’s job to teach a child social skills?—the reality is that educators and mental health professionals in schools need to be continually reinforcing positive social skills through direct and indirect instruction (NASP, 2002). An increased number of children are coming to school without the adequate repertoire of social skills required to help them strengthen interpersonal relationships and facilitate success in school (Knoff, 2002; MASP, 2002).

What are the elements of effective social skills interventions?

To begin with, the most effective social skills programs are comprised of two key elements: “a teaching process that uses a behavior/social learning approach and a universal language or set of steps that facilitates the learning of the new behavior” (NASP, 2002). In addition, a systematic approach is also essential to the social and emotional learning process, and it is critical that supportive and responsive relationships are in place to help the student as they learn the skills (Hemmeter, 2005).

Other key elements to keep in mind when looking at social skills programs are training and support for parents and the comprehensiveness of the program. In research, programs with a parent education/support component have been shown to be more effective, and interventions that are adapted and targeted to meet individual or group needs have shown the most success (Hemmeter, 2005; NASP, 2002).

The matrix on the following pages contains evidence-based programs and interventions targeting Social Skills instruction in schools.
